

Cleaning up the chemical industry

The chemical industry in central Europe struggles with excessive waste, high greenhouse gas emissions, and a strong reliance on petroleum-based materials. The GreenChemForCE project helps companies to change production processes from linear production streams to circular systems. The partners test new technologies that reduce hazardous solvents and reuse remaining ones. They also develop a strategy for the production of greener chemicals and train a wide range of companies on how to apply them to clean up the sector.
